1. A system for preventing accidents in the operation of machine or apparatus (56), with:

at least one user end device or terminal (2) with an output unit (10) for the transmission of authorizing user data signals through the body of a user, and

at least one signal receiver (28) assigned to the monitored apparatus or machine (56) having an interface unit (30) for receiving signals transmitted through the body of the user, unit (36-40, 44-48) for checking the received user data dealing with authorization and units (42, 50, 54) for outputting a clearance signal that allows an operation of the at least one machine or apparatus (56) after a successful test of the received authorizing user data, whereby

the signal receiver (28) is equipped and programmed to terminate the output of the clearance signal following a successful test of the authorization data, when subsequent tests of the authorization data fail.

2. The system according to claim 1 wherein the output unit (10) of the user end device or terminal (2) comprises a coupling unit (4) for the inductive and/or capacitive coupling of the authorizing user data signal into the body of the user.

3 .

- 3. The system according to claim 1 or claim 2 in which the output unit (10) of the user end device or terminal (2) has a contact region (6) for direct coupling of the authorizing user data signal into the body of the user and/or a signal output (8) for transmitting the signals comprising the authorization user data to a device directly connected with the body of the first user.
  - 4. The system according to one of the preceding claims in which the user end device or terminal (2) is equipped and programmed to transmit signals which comprise a code giving authorization to the user and control commands for controlling the signal receiver (28).
  - 5. The system according to one of the preceding claims in which the interface unit (30) of the signal receiver (28) comprises a contact sensitive unit which receives the signals from the user end device or terminal (2) upon contact of the contact sensitive unit with the user.
  - 6. The system according to one of the preceding claims in which the interface (30) of the signal receiver (28) has an inductive and/or capacitive unit for receiving the signals of the user end device or terminal (2) by means of inductive and/or capacitive signal transmission.

- 7. The system according to one of the preceding claims in which the unit (36-40, 44-48) of the signal receiver (28) or testing the authorizing data, comprise a correspondence register (46) with at least two storage or memory location or data or testing the authorizing data.
- 1 8. The system according to one of the preceding claims
  2 in which the signal receiver (28) is equipped and programmed
  3 depending upon the received signal from the user end device or
  4 terminal (2) to access data for testing the data to serve as
  5 authorization data.
- 9. The system according to one of the preceding claims in which at least one user end device (2) is arranged in or on protective clothing.
- 10. A user end device or terminal (2) for use with the
  2 system according to one of the preceding claims with an output unit
  3 (10) for transmitting authorizing data signals through this body of
  4 a user.
- 11. A user end device or terminal (2) according to claim
  2 10 with the features according to one of claims 2 4.
- 1 12. A user end device or terminal (2) according to claims 10 or 11, for arrangement on or in protective clothing.

- 13. A signal receiver (28) for use with the system
  2 according to one of claims 1 9 with:
- an interface (30) for receiving through a body of a user signals comprising authorization data and transmitted through the body of the user,
- units (36-40, 44-48) for testing the received authorizing data, and
- units (42, 50, 54) for producing a clearance signal
  upon a successful test of the authorizing data, whereby the signal
  receiver (28) is equipped and programmed to terminate the clearance
  signal outputted as a result of a successful test of the
  authorizing data when subsequent tests of the authorizing data
  fail.
- 14. The signal receiver (28) according to claim 13 with the features according to one of claims 5 - 9.
- 15. Protective clothing, like for example a protective 2 helmet, protective glasses or goggles, safety shoes and the like 3 with the user end device or terminal (2) according to one of claims 4 10 - 12.
- 16. A device or apparatus like a household appliance,
  2 electric and mechanical tool, machine tool or the like with the
  3 signal receiver (28) according to claims 13 or 14.

- 17. A hand grip device with a hand grip based body
  including a hand grip outer surface (7) which is engaged by an
  inner surface of the hand and has a segment forming a hand rest for
  the inner surface, whereby in the region of the hand inner surface
  rest at least one pressure sensitive zone (8) is formed for
  generating a signal indicating the hand grip gripping state.
- 18. The hand grip arrangement of claim 17, characterized in that it includes a plurality of pressure sensitive zones (8).
- 1 19. The hand grip device according to claims 17 or 18
  2 characterized in that the pressure sensitive zone forms part of a
  3 fluid chamber system (9).
- 20. The hand grip device according to at least one of claims 17 19, characterized in that the pressure sensitive zone is formed by an elastically deformable pressure chamber wall.
- 21. The hand grip device according to at least one of claims 17 20, characterized in that the pressure chamber is filled with a liquid, gel or gas.
- 22. The hand grip device according to at least one of claims 17 21, characterized in that the pressure chamber is coupled with a switch device.

- 23. The hand grip device according to at least one of claims 17 22, characterized in that the pressure chamber is coupled with a pressure measurement device.
- 24. The hand grip device according to at least one of claims 17 23, characterized in that the hand grip device in the region of the hand inner surface rest has pressure sensitive zones in the hand ball rest region and a finger inner surface rest region.
- 25. The hand grip device according to at least one of claims 17 24, characterized in that in the region of the hand grip device a plurality of individual finger inner surface pressure sensitive zones are provided.
- 26. The hand grip device according to at least one of claims 17 25, characterized in that in the region of the hand grip device an orientation detecting device is provided.
- 27. The hand grip device according to at least one of claims 17 26, characterized in that the hand grip device is a hand grip of a drill.

- 28. The hand grip device according to at least one of claims 17 27 in which a signal transmitting device is coupled a signal to the user.
- 29. The hand grip device according to claim 28 characterized in that the signal transmitter device is so configured that it effects a signal coupling on the basis of electrostatic interaction.
- 30. The hand grip device according to at least one of claims 17 29, characterized in that in the hand grip device a signal modulating device is provided for the modulation of the signal imitated by the coupling device.
- 31. The hand grip device according to at least one of claims 17 30, characterized in that the signal is so modulated that it contains a dated telegram.
- 32. A power driven tool with a housing device, a first hand grip device (105), a second hand grip device (106) and a device for detecting the gripping state for producing a signal indicating the gripping state of the device.
